

## **Exploring Evidence Based Behavioral Intervention Model, Applied Behavioral Analysis**

**Presenter:** Doreen Granpeesheh

**Intended audience:** Families, Caregivers, Providers, Physicians, Clinicians

### **Session Description**

Treatments grounded in Applied Behavior Analysis as well as biomedical treatments have individually helped provide effective treatment models for autism. Although ABA-based interventions are now considered to be at the forefront of therapeutic interventions for children with autism, in recent years, evidence for successful outcomes with biomedical treatments has also been observed. Ultimately, in developing a “Best Practices” Model, these interventions must work together to provide the best possibilities for optimal outcomes.

An overview of support for the behavioral-biomedical treatment model will be presented.
